**“Oracle’s Primavera P6 Professional Project Management has enabled us to improve the precision with which we manage our large engineering and construction projects. As important, Oracle Primavera, which is an industry standard, has helped us to improve our standing with clients.”** – Patrícia Steter, Planning Manager, Matec Engenharia

## Matec Engenharia Boosts Productivity with Robust Project Planning and Management Solution

Matec Engenharia is a construction company based in Brazil. Founded in December 1990, Matec’s portfolio includes more than 300 completed construction projects, including industrial buildings, shopping centers, high-rise residential places and office buildings, hotels, and universities.

### Challenges

- Implement a project management solution that will support the company’s corporate vision and enterprise transparency initiatives, making information accessible to all the company
- Automate management of third parties and absorb knowledge developed by service providers, making more accurate construction project calculations
- Ensure accurate calculations on engineering projects to improve the organization’s ability to complete projects on time
- Control project deadlines and allow comprehensive business vision, considering possible external interferences, such as rainy periods or lack of resources, by monitoring project phases

### Solution

- Worked with Oracle Partner Verano Engenharia e Sistemas to replace the legacy system with Oracle’s Primavera P6 Professional Project Management, adapting the environment to the concept of knowledge management and enhancing accuracy
- Established methodology that enabled Matec to reduce errors in estimating the time and controlling construction projects
- Improved reliability with clients by migrating to the Primavera system from Oracle for construction project development and management and established a methodology that enabled real-time queries of project data
- Improved management of staff availability by migrating from a project-based management to activity-based management and introducing a model that accounts for market conditions and climatic variations
- Gained the ability to anticipate problems and improved time management during project execution—driving to accomplish contractual commitments
