“Oracle’s Primavera project management software has given us better control of and greater insight into our business. With accurate, up-to-date data at our fingertips, we have improved the way we plan and manage our land and property development projects. The result is quality residential and commercial buildings that are in high demand.” – Tuan Duy Cao, IT Manager, Nam Long Group

Nam Long Group Improves Management of Land and Property Development Projects across Vietnam

Founded in 1992, Nam Long Group comprises eight subsidiaries and six associate companies focused on land development projects and programs for general land use, residential, and commercial property. Nam Long Group’s three shareholders include ASPL, an investment fund owned by a Malaysian property developer; Nam Viet Company, a major Vietnamese conglomerate; and Vietnam Azalea Fund.

Challenges

- Required greater management control over development projects across Vietnam
- Reduce the need for managers to travel to sites to monitor the status of projects
- Improve resource allocation and manage risks to ensure projects do not exceed budgets and are delivered on time

Solution

- Engaged Oracle Gold Partner Ketnoi Project Management Service (KPMS) to deploy Oracle’s Primavera P6 Enterprise Project Portfolio Management to provide a central project management platform for the business
- Provided a single dashboard environment so managers can check key performance indicators around budgets, costs, schedules, and resources across all active development projects
- Ensured project managers can check on the status of land and property developments at any time, as schedules are now updated in the system, rather than collated manually
- Minimized risk by monitoring project schedules and budgets on a daily basis, and addressing any issues before deadlines and budgets are affected
- Reduced project costs through better allocation of resources such as building materials and labor
- Improved enterprisewide communication and enabled effective collaboration on joint projects between the land, residential, and commercial property development units
- Achieved a smooth migration by working with KPMS to conduct a feasibility study to determine business requirements, design reports, undertake a proof-of-concept, migrate legacy data to the Primavera platform, and provide end-user training
